

Racial disparities in healthcare, childcare, and education remains a critical issue faced by Black children in America.

We offer solution-driven services to improve the early intervention, diagnosis, and treatment of autism and other neurological conditions among Black children in our communities.

According to Research:

On average, it takes three years before a black child with autism receives a formal diagnosis, resulting in the need for longer and more intensive interventions. (U.S. Centers for Disease Control and Prevention)

We can help.

- Free access to our online screening tool, the Ages & Stages Questionnaire
- Intensive early intervention and caregiver outreach
- Streamlined diagnostic approach for a quicker introduction to therapy
